**Abstract:** Product selection in processes production companies. Materials manufacturing process. An incorrect choice subject can lead to a defective end product. Therefore, proper selection of ingredients should be given more importance expected. There are many Exams and various criteria in selecting and an object specific use. These criteria range from mechanical, electrical and physical properties to corrosion resistance and economic considerations of materials. With complex relationships between various selections parameters available in A large number material. Make Selection Process a daunting task. The application from two or more alternatives based multiple there may be criteria considered Multi-criteria decision-making (MCDM) problem This paper mainly focuses on solving two real-time material selection problems, which is an almost unexplored MCDM tool to solve such complex decision-making problems. Using applied additive (ARAS) method. Ranking performance ARAS The method is comparable to Other MCDM methods have been accepted. Polycarbonate is highest value and polypropylene is the lowest value. Already various MCDM techniques exist used by past researchers to solve Material selection issues. Similar to the optimal solution method for ranking ordered alternatives (ARAS), Zibo and Kang used the technique of ordered priority, while using Entropy method estimate Weight of each item considering multiple requirements. Capua introduced a fuzzy logic approach to handling quality attributes objects and ambiguous space to solve various Material selection issues. Shania Sawatoko used the ARAS method for material selection and it is a very sensitive material for purposes involving conflicting and multi-design elements including graph theory and team approach and engineering, they adopted the Advanced Harmony Ranking System (ARAS) for material selection. Chan and Dong pair an integrated methodology for creating a series of objects; they also proposed a product strategy for object selection through end-of-life gray correlation analysis. Dehghan-Manshadi proposed a weighted property method by combining nonlinear Normalization with modified digital logic technique for object selection for mechanical design. Design Lula developed an intelligent method of handling information related to material selection issues, working conditions and design structures.

**Keywords:** MCDM

### **1. INTRODUCTION**

Changing and selecting materials various applications are common. It is Note in some cases, there is more than one Definite criterion choosing Right one type Meaning. Designers and Engineers must calculate a large number of material selection criteria. Specialists in general use Trial and error methods or developing the former experiments. In this paper, a novel approach is taken using elimination Material selection result criterion sensitivity analysis. It can be used Get more accurate Choose a subject specific application, inch a Logical ranking item being considered. By material selection criteria inch production, you can get choices, down to the best and worst matching items. A loaded heat conductor can be successfully used to select Material suitable for a particular application, this work showing good agreement between the methods used and the Cambridge Engineering Analyst Databases. A computer program is developed for ease-of-use mathematics and other subject tests. Already various MCDM techniques exist used by past researchers to solve Material selection issues. Similar to the optimal solution method for ranking ordered alternatives (ARAS), Zibo and Kang used the technique of ordered priority, while using Entropy method estimate Weight of each item considering multiple requirements. Capua introduced a fuzzy logic approach to handling quality attributes objects and ambiguous space to solve various Material selection issues. Shania Sawatoko used the ARAS method for material selection and it is a very sensitive material for purposes involving conflicting and multi-design elements including graph theory and team approach and engineering, they adopted the Advanced Harmony Ranking System (ARAS) for material selection. Chan and Dong pair an integrated methodology for creating a series of objects; they also proposed a product strategy for object selection through end-of-life gray correlation analysis. Dehghan-Manshadi proposed a weighted property

method by combining nonlinear Normalization with modified digital logic technique for object selection for mechanical design. Design Lula developed an intelligent method of handling information related to material selection issues, working conditions and design structures Related information on alternatives; Styrene Maleic Anhydride, Polycarbonate, Polypropylene, Acrylonitrile Butadiene, Composites Epoxy Aramid Polycarbonate High Value and Polypropylene Low Value.

## 2. MATERIAL SELECTION

The second materials which consists of three main components: the, the acetabulum. A Femoral organ natural femoral head replacement femur, a rigid pin inserted into a perforated shaft of bone, fixed with molding. Acetabular interface minimizes wear debris caused by friction between femur the acetabular. There pin and cup attached the adhesive cements to the surrounding bony structure and performs various functions. In this example, the choice of the pin material is considered and the resulting structure of this problem shows Performance matrix for substitutes. It can be observed Objective data only is available in this subject Selection problem. But very selective suitable Materials for engineering use can be taken inside framework the proposed approach in context. In the following, the application ARAS-MCDM approach in this case explained. Of the nine criteria, C1, C2, C6 the Benefit criteria, C7 and C8 the sustainability scale, and is C9 the Cost scale. Basically, the proximity of the Human bone, very favorable value is determined for C7 and C8, respectively. The two examples presented above represent Very much relevant Material in engineering design processes, which demonstrate the applicability and effectiveness of the proposed approach to selection. However, compared to existing Subject Selection Methods, The MCDM-ARAS the framework proposed in this paper has the following desirable advantages: Uncertainty and ambiguity better information for decision making represented and modeled using ARASs. Furthermore, the proposed approach can consider both subjective evaluations and objective data during the material selection process. Based on the maximum distance measurement, information about criterion weights is completely unknown or to manage object Selection problems where is information completely unknown. The three types Criteria of Engineering Design namely Benefit, cost and determinism May the material is taken into account in the selection. The proposed approach is a general method and can be considered multiple criteria. By using a modified MCDM Method, too fair reliable ranking result can be achieved which will ensure the result and facilitate Material selection assistance and judgment. Alternatives; Styrene Maleic Anhydride, Polycarbonate, Polypropylene, Acrylonitrile Butadiene, Epoxy Aramid Composites To evaluate material selection development projects Criteria in a group meeting Nominal with three academic material selection chain experts Obtained using panel technique. Independently of the list of conditions Experts were asked to develop. In material selection Development Program Evaluation an Initial Literature review Compiled using List of criteria, to start the idea generation process Available to experts upon request. Until all experts have completed their lists, from the evaluation committee members in a round-robin format at a time a criterion was recorded. Dependence of each criterion on others for clarity or experts was allowed to discuss only without influence. Experts have also evaluated these criteria independently. Once the process is complete, based on voting and math panel of individual rankings Prioritization of criteria was determined.

## 3. ARAS METHOD

The ARAS system is complex World events simplified using relative comparisons it is based on the argument that it can be understood. Normalized and of weighted scales for sum of values, it is under consideration Describes an alternative. These criteria are optimal and describe Optimal condition; this is achieved by substitution in comparison. Most useful and from rated to select the actual alternative, the best alternative is artificially created Analyzed real from the xi-indicator data of AI Alternatives Modeling the best alternative. While doing calculations, Alternative airs better the alternative is compared to a0. Calculation process Taking into account, Optimum function ~ Silvanus of the studied parameters xij and weights ω~ j and their corresponding in the final result Live with influence and has a proportional relationship Therefore, optimal function ~ Si, A very useful alternative. Priorities of alternatives can be determined according to value of Si Because of this, when using this method, evaluate decision alternatives ranking is convenient. Polycarbonate is the highest value and polypropylene is the lowest value.

## 4. ANALYSIS AND DISCUSSION

TABLE 1. Alternatives

styrene maleic anhydride	A1
Polycarbonate	A2
polypropylene	A3
acrylonitrile butadience styrene	A4
Composites epoxy aramid	A5

Table 1 show that the alternatives.

**TABLE 2.** Evaluation

recyclability	C1
Elongation	C2
weight	C3
tensile strength	C4
cost	C5
toxicity level	C6

Table 2. shown that the evaluation

**TABLE 3.** Material Selection

	C1	C2	C3	C4	C5	C6
<b>A1</b>	36.24	44.32	92.43	87.13	78.32	97.47
<b>A2</b>	38.45	49.78	86.46	89.46	87.52	98.39
<b>A3</b>	31.26	45.69	94.43	79.48	84.65	90.65
<b>A4</b>	39.59	49.35	91.46	87.43	79.35	88.54
<b>A5</b>	35.68	47.58	87.64	78.68	80.31	99.83

Table 3 is given for the data set. This is for hundreds of values that the material selection works with, all material selection C1 values are the lowest and C6 values are the highest. Therefore, as economic and business values are very low and quality is very high, as seen in Figure 1, material selection ' performance is very high.

**FIGURE 1** Graph of data set

**TABLE 4.** Maximum value

	C1	C2	C3	C4	C5	C6
<b>Max</b>	<b>39.59</b>	<b>49.78</b>	<b>94.43</b>	<b>89.46</b>	<b>87.52</b>	<b>99.83</b>
<b>A1</b>	36.24	44.32	92.43	87.13	78.32	97.47
<b>A2</b>	38.45	49.78	86.46	89.46	87.52	98.39
<b>A3</b>	31.26	45.69	94.43	79.48	84.65	90.65
<b>A4</b>	39.59	49.35	91.46	87.43	79.35	88.54
<b>A5</b>	35.68	47.58	87.64	78.68	80.31	99.83

Table 4 calculated for maximum value for data set. Is taken for ranking in finally.

**TABLE 5.** Normalized for data set

	<b>C1</b>	<b>C2</b>	<b>C3</b>	<b>C4</b>	<b>C5</b>	<b>C6</b>
<b>Max</b>	<b>0.179294</b>	<b>0.173752</b>	<b>0.17268</b>	<b>0.17485</b>	<b>0.17586</b>	<b>0.173705</b>
<b>A1</b>	0.164123	0.154695	0.169023	0.170296	0.157373	0.169599
<b>A2</b>	0.174132	0.173752	0.158106	0.17485	0.17586	0.171199
<b>A3</b>	0.14157	0.159476	0.17268	0.155344	0.170093	0.157732
<b>A4</b>	0.179294	0.172251	0.167249	0.170882	0.159443	0.15406
<b>A5</b>	0.161587	0.166073	0.160263	0.15378	0.161372	0.173705

Table 5 Data for analysis are transformed into normalized data. In which all values are less than 1. This makes the analysis easier. A weight age value of 0.25 is taken for all the data to get the normalized matrix.

**TABLE 6.** Weighted Normalized Matrix

Weighted Normalized Matrix						
	<b>C1</b>	<b>C2</b>	<b>C3</b>	<b>C4</b>	<b>C5</b>	<b>C6</b>
<b>Max</b>	0.044824	0.043438	0.04317	0.043712	0.043965	0.043426
<b>A1</b>	0.041031	0.038674	0.042256	0.042574	0.039343	0.0424
<b>A2</b>	0.043533	0.043438	0.039526	0.043712	0.043965	0.0428
<b>A3</b>	0.035392	0.039869	0.04317	0.038836	0.042523	0.039433
<b>A4</b>	0.044824	0.043063	0.041812	0.04272	0.039861	0.038515
<b>A5</b>	0.040397	0.041518	0.040066	0.038445	0.040343	0.043426

Table 6. With this we can get sum of value. Weighted Normalized Matrix is obtained in

**TABLE 7** Si and Ki value

	<b>Si</b>	<b>Ki</b>
<b>Max</b>	0.262535	1
<b>A1</b>	0.246277	0.938072
<b>A2</b>	0.256974	0.978819
<b>A3</b>	0.239223	0.911206
<b>A4</b>	0.250795	0.955281
<b>A5</b>	0.244195	0.930143

From table 7 sum of value is obtained and Ki value is obtained. Ki value is obtained by dividing Si Max value. This can be seen in Figure 2.

**FIGURE 2** Graph for Si and Ki value

**TABLE 8.** Rank

	Rank	Rank
styrene maleic anhydride	<b>A1</b>	3
Polycarbonate	<b>A2</b>	1
polypropylene	<b>A3</b>	5
acrylonitrile butadiene styrene	<b>A4</b>	2
Composites epoxy aramid	<b>A5</b>	4

The ranking is obtained from Table 8. It is not multiplied by Table 7. In this, Polycarbonate is the highest value and polypropylene is the lowest value.

**FIGURE 3.** Shown the Rank

Figure 5. The ranking is obtained from Polycarbonate is the highest value and polypropylene is the lowest value.

## 5. CONCLUSION

Product selection it processes production companies. Materials manufacturing process. An incorrect choice Material can lead to a defective end product. Therefore, proper selection of ingredients should be given more importance expected. There are many choices and different criteria in selecting and an object specific use. These criteria range from mechanical, electrical and physical properties of materials as in numbers materials Available with daunting. Material problem selection alternatives based multiple criteria can be considered Multi-criteria decision-making (MCTM) This paper mainly focuses on solving two real-time problems object Selection problems, which are more complex using the applied additive (ARAS) method. MCDM is an almost unexplored tool for solving decision-making problems. Ranking performance ARAS The method is comparable to Other MCDM methods have been accepted. Alternatives; Styrene Maleic Anhydride, Polycarbonate, Polypropylene, Acrylonitrile Butadiene, Composites Epoxy Aramid Polycarbonate High value and Polypropylene Low value.
