Abstract. *In the 1980s and 1990s, a field known as scientific computing or computational science began to emerge as a result of the increasing significance of using computers to carry out numerical operations in order to solve mathematical models of the world. This paper examines numerical analysis’s application from a computer science view point; see[3][4][5].In this paper, Iterative methods like Gauss Jacobi and Gauss Serial were used to solve the system of simultaneous equation by using Python Programming.*

Key Words: *Numerical Analysis, Gauss Jacobi and Gauss Seidal*

1.INTRODUCTION

Numerical techniques is essentially a discipline of mathematics where issues are resolved numerically and with the use of Now include so phisticated numerical analysis software, enabling many users to undertake modeling even if they are not familiar with the underlying mathematics. Python programming is general-purpose interpreted, interactive, object oriented and high level programming language[2].

2. GAUSS JACOBI METHOD

Consider the system of equations

$$a_{11}x_1+a_{12}x_2+\dots+a_{1n}x_n=c_1$$

$$a_{21}x_1+a_{22}x_2+\dots+a_{2n}x_n=c_2$$

$$a_{n1}x_1+ a_{n2}x_2+ \dots+a_{nn}x_n=c_n$$

We assume that the coefficient matrix of this system is diagonally dominant [(i.e.) the system is a diagonal system. The above equations can be written as

$$x_1 = \frac{1}{a_{11}} [c_1-a_{12} x_2-a_{13} x_3 \dots - a_{1nxn}]-\dots \tag{1}$$

$$x_2 = \frac{1}{a_{22}} [c_2-a_{21} x_1-a_{23} x_3 \dots - a_{2nxn}]-\dots \tag{1}$$

$$x_n = \frac{1}{a_{nn}} [c_n-a_{n1} x_1-a_{n3} x_3 \dots - a_{n, -1}x_{n-1}]-\dots \tag{n}$$

We start the initial z values for the variables $x_1, x_2, x_3, \dots, x_n$ to be

$$x_1^{(0)}, x_2^{(0)}, x_3^{(0)}, \dots, x_n^{(0)}$$

Using this values in (1), (2), (3), ... (n) respectively we get $x^{(1)}, x^{(1)}, x^{(1)}, \dots, x^{(1)}$

Putting $x = x^{(1)}, x = x^{(1)}, \dots, x = x^{(1)}$ in

(1),(2),(3),...(n) respectively we get the next approximations $x_1^{(2)}, x_2^{(2)}, x_3^{(2)}, \dots, x_n^{(2)}$. In general if the values of $x_1, x_2, x_3, \dots, x_n$ in their r^{th} alteration are $x_1^{(r)}, x_2^{(r)}, x_3^{(r)}, \dots, x_n^{(r)}$ then

$$x_1^{(r+1)} = \frac{1}{a_{11}} [c_1 - a_{12}x_2^{(r)} - a_{13}x_3^{(r)} - \dots - a_{1n}x_n^{(r)}]$$

$$x_2^{(r+1)} = \frac{1}{a_{22}} [c_2 - a_{21}x_1^{(r)} - a_{23}x_3^{(r)} - \dots - a_{2n}x_n^{(r)}]$$

$$\dots$$

$$z_1 = \frac{1}{5} [54.8] = 3.6533$$

$$x_n^{(r+1)} = \frac{1}{a_{nn}} [c_n - a_{n1}x_1^{(r)} - a_{n2}x_2^{(r)} - \dots - a_{n,n-1}x_{n-1}^{(r)}]$$

Solving equations using Jacobi’s iteration method

$$3x+4y+15z=54.8;$$

$$x+12y+3z=39.66;$$

$$10x+y-2z=7.74$$

Solution: Coefficient matrix of the given set

Of equation is A= $\begin{bmatrix} 3 & 4 & 15 \\ 1 & 12 & 3 \\ 10 & 1 & -2 \end{bmatrix}$

We note that A is not diagonally dominant

Also, A ~ $\begin{bmatrix} 10 & 1 & -2 \\ 1 & 12 & 3 \\ 3 & 4 & 15 \end{bmatrix} R_1 \leftrightarrow R_3$

Which is diagonally dominant. The given system becomes

$$10x+y-2z=7.74 \dots \dots \dots (1)$$

$$x+12y+3z=39.66 \dots \dots \dots (2)$$

$$3x+4y+15z=54.8 \dots \dots \dots (3)$$

From (1), (2) and we gets

$$X = \frac{1}{10} [7.74 - y + 2z] \dots \dots \dots (4)$$

$$Y = \frac{1}{12} [39.66 - x - 3z] \dots \dots \dots (5)$$

$$Z = \frac{1}{15} [54.8 - 3x - 4y] \dots \dots \dots (6)$$

First Iteration:

Let the initial value be $x_0 = y_0 = z_0 = 0$. From (4), (5) and (6)

$$x_1 = \frac{1}{10} [7.74] = 0.774$$

$$y_1 = \frac{1}{12} [39.66] = 3.305$$

Second Iteration:

$$x_2 = \frac{1}{10} [7.74 - y_1 + 2z_1] = \frac{1}{10} [7.74 - 3.505 + 7.3066] = 1.1742$$

$$y_2 = \frac{1}{12} [39.66 - x_2 - 3z_1] = \frac{1}{12} [39.66 - 0.774 - 10.9599] = 2.3272$$

$$z_2 = \frac{1}{15} [54.8 - 3x_2 - 4y_1] = \frac{1}{15} [54.8 - 2.322 - 13.22] = 2.6172$$

Third Iteration:

$$x_3 = \frac{1}{10} [7.74 - y_2 + 2z_2] = \frac{1}{10} [7.74 - 2.3272 + 5.2344] = 1.0647$$

$$y_3 = \frac{1}{12} [39.66 - x_3 - 3z_2] = \frac{1}{12} [39.66 - 1.1742 - 7.8516] = 2.5529$$

$$z_3 = \frac{1}{15} [54.8 - 3x_3 - 4y_2] = \frac{1}{15} [54.8 - 3.5226 - 9.3088] = 2.7979$$

Fourth Iteration:

$$x_4 = \frac{1}{10} [7.74 - y_3 + 2z_3] = \frac{1}{10} [7.74 - 2.5529 + 5.5958] = 1.0783$$

$$y_4 = \frac{1}{12} [39.66 - x_4 - 3z_3] = \frac{1}{12} [39.66 - 1.0647 - 8.3937] = 2.5168$$

$$z_4 = \frac{1}{15} [54.8 - 3x_4 - 4y_3] = \frac{1}{15} [54.8 - 3.1941 - 10.2116] = 2.7596$$

Fifth Iteration:

$$x_5 = \frac{1}{10} [7.74 - y_4 + 2z_4] = \frac{1}{10} [7.74 - 2.5168 + 5.5192] = 1.0742$$

$$y_5 = \frac{1}{12} [39.66 - x_5 - 3z_4] = \frac{1}{12} [39.66 - 1.0783 - 8.2788] = 2.5252$$

$$z_5 = \frac{1}{15} [54.8 - 3x_5 - 4y_4] = \frac{1}{15} [54.8 - 3.2249 - 10.0672] = 2.7665$$

Sixth Iteration:

$$x_6 = \frac{1}{10} [7.74 - y_5 + 2z_5] = \frac{1}{10} [7.74 - 2.5252 + 5.533] = 1.0783$$

$$y_6 = \frac{1}{12} [39.66 - x_5 - 3z_5] = \frac{1}{12} [39.66 - 1.0742 - 8.2995] = 2.5239$$

$$z_6 = \frac{1}{15} [54.8 - 3x_5 - 4y_5] = \frac{1}{15} [54.8 - 3.2226 - 10.1008] = 2.7651$$

Seventh Iteration:

$$x_7 = \frac{1}{10} [7.74 - y_6 + 2z_6] = \frac{1}{10} [7.74 - 2.5239 + 5.5302] = 1.0746$$

$$y_7 = \frac{1}{12} [39.66 - x_6 - 3z_6] = \frac{1}{12} [39.66 - 1.0748 - 8.2953] = 2.5242$$

$$z_7 = \frac{1}{15} [54.8 - 3x_6 - 4y_6] = \frac{1}{15} [54.8 - 3.2244 - 10.0956] = 2.7653$$

After 7 iteration the difference in 6th and 7th iteration are negligible. Hence the solution of the system is given by $x=1.075$; $y=2.524$; and $z=2.765$

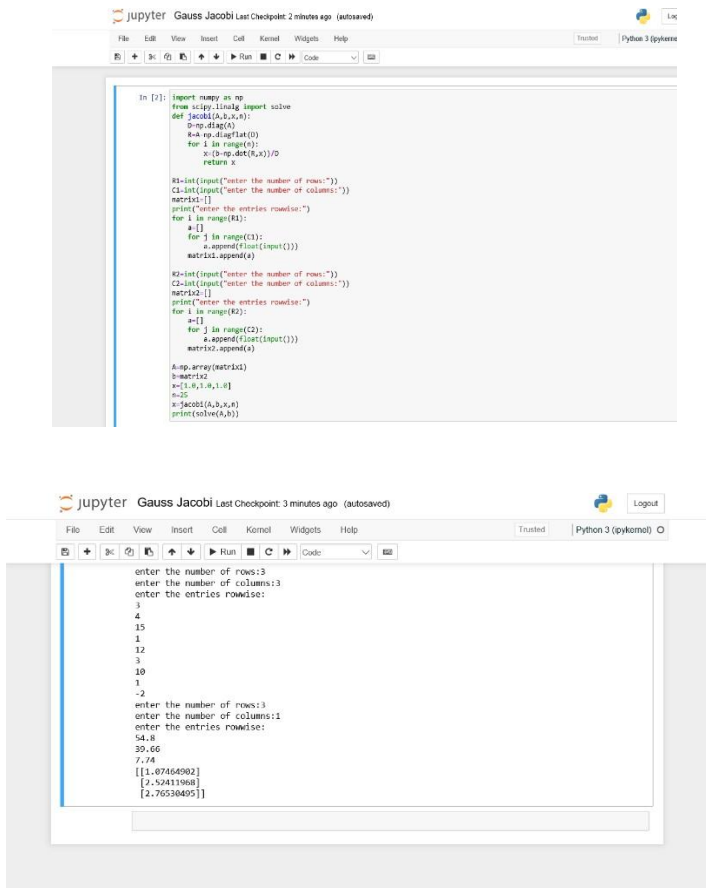

Python Code to Solve Simultaneous Equation by Gauss Jacobi:

```
import numpy as np from scipy.linalg import solve def jacobi (A,b,x,n):
D=np.diag(A)
R=A-np.diag flat(D)
for i in range (n):
x= (b-np.dot(R,x))/D return x
R1=int(input("enter the number of rows:"))
C1=int(input("enter the number of columns:"))

matrix1= []
Print ("enter the entries row wise :")
for i in range (R1):a=[]
for j in range (C1): append (float (input ())) matrix1.append (a)
R2=int (input("enter the number of rows:"))
C2=int (input("enter the number of columns:"))

matrix2=[]
print("enter the entries row wise:")for i in range(R2): a=[] for j in range (C2):a. append (float (input()))
matrix2. Append (a)
A= np. Array (matrix1)
b= matrix2
x= [1.0,1.0,1.0]
n=25
x=Jacobi (A,b,x,n)
print (solve(A,b))
```

Illustration of Gauss Jacobi in Jupyter Note

3. GAUSS SEIDAL METHOD

Gauss-Seidelite ration method is finement of Gauss-Jacobi method. As in Jacobi method let

$$x_1 = \frac{1}{a_{11}} [c_1 - a_{12} x_2 - a_{13} x_3 - \dots - a_{1n} x_n]$$

.....(1)

$$x_2 = \frac{1}{a_{22}} [c_2 - a_{21} x_1 - a_{23} x_3 - \dots - a_{2n} x_n]$$

----- (2)

⋮ ⋮ ⋮

$$x_n = \frac{1}{a_{nn}} [c_n - a_{n1} x_1 - a_{n2} x_2 - \dots - a_{n,n-1} x_{n-1}]$$

----- (n)

We start with the initial values $x^{(0)}, \dots, x^{(0)}$ and we get from(1)

$$x_1^{(1)} = \frac{1}{a_{11}} [c_1 - a_{12}x_2^{(0)} - a_{13}x_3^{(0)} - \dots - a_{1n}x_n^{(0)}]$$

In the second equation we use $x_1^{(1)}$ for x_1 And $x_2^{(0)}$ for x_2 etc. and $x_n^{(0)}$ for x_n . In the Jacobi Method we use $x_1^{(0)}$ for x_1 . Thus we get,

$$x_2^{(1)} = \frac{1}{a_{22}} [c_2 - a_{21}x_1^{(1)} - a_{23}x_3^{(0)} - \dots - a_{2n}x_n^{(0)}]$$

Proceeding like this we find the first iteration values as $x_1^{(1)}, x_2^{(1)}, \dots, x_n^{(1)}$. In general if the values of the variables in the r^{th} iteration are given by

$$x_1^{(r+1)} = \frac{1}{a_{11}} [c_1 - a_{12}x_2^{(r)} - a_{13}x_3^{(r)} - \dots - a_{1n}x_n^{(r)}]$$

$$x_2^{(r+1)} = \frac{1}{a_{22}} [c_2 - a_{21}x_1^{(r)} - a_{23}x_3^{(r)} - \dots - a_{2n}x_n^{(r)}]$$

$$\vdots$$

$$x_n^{(r+1)} = \frac{1}{a_{nn}} [c_n - a_{n1}x_1^{(r)} - a_{n2}x_2^{(r)} - \dots - a_{n,n-1}x_{n-1}^{(r)}]$$

Solving system of equation using Gauss Seidel iteration method:

$$6x+15y+2z=72;$$

$$x+y+54z=110;$$

$$27x+6y-z=85$$

Solution: Coefficient matrix of the given system of equation is

$$A = \begin{bmatrix} 6 & 15 & 2 \\ 1 & 1 & 54 \\ 27 & 6 & -1 \end{bmatrix}$$

We note that A is not

Diagonally dominant. However, it can be made diagonally dominant the rows

$R_1 \rightarrow R_2$ and then $R_2 \leftrightarrow R_3$

$$A = \begin{bmatrix} 27 & 6 & -1 \\ 6 & 15 & 2 \\ 1 & 1 & 54 \end{bmatrix}$$

Hence the corresponding system of equation is

$$\begin{aligned} 27x+6y-z &= 85 \\ 6x+15y+2z &= 72 \\ x+y+54z &= 110 \end{aligned}$$

The above system of equation can be rewritten as

$$X = \frac{1}{27} (85 - 6y + z) \dots\dots\dots (1)$$

$$Y = \frac{1}{15} (72 - 6x - 2z) \dots\dots\dots (2)$$

$$Z = \frac{1}{54} (110 - x - y) \dots\dots\dots (3)$$

First Iteration:

Putting $y=0$ and $z=0$ in (1) we get $x = \frac{85}{27} = 3.1481$,

Putting $x=3.1481$ and $z=0$ in (2) we get $y = \frac{1}{15} [72 - 6 \times 3.1481] = 3.5408$

Putting $x= 3.1481, y=3.5408$ in (3)

We get $z = \frac{1}{54} [110 - 3.1481 - 3.5408] = 1.9132$

Second Iteration:

Putting $y= 3.5408$ and $z=1.9132$ in

(1) we get $x = \frac{1}{27} [85 - 6 \times 3.5408 + 1.9132] = 2.4322$

Putting $x=2.4322$ and $z= 1.9132$ in

(2) we get $y = \frac{1}{15} [72 - 6 \times 2.4322 - 2 \times 1.9132] = 3.572$

Putting $x=2.4322$ and $y=3.572$ in (3)

We get $z = \frac{1}{54} [110 - 2.4322 - 3.572] = 1.9258$

Third Iteration:

Putting $y= 3.572$ and $z=1.9258$ in (1)

we get $x = \frac{1}{27} [85 - 6 \times 3.572 + 1.9258] = 2.4257$

Putting $x=2.4257$ and $z=1.9258$ in

(2) we get $y = \frac{1}{15} [72 - 6 \times 2.4257 - 2 \times 1.9258] = 3.5729$

Putting $x=2.4257$ and $y=3.5729$ in

(3) we get $z = \frac{1}{54} [110 - 2.4257 - 3.5729] = 1.926$

Fourth Iteration:

Putting $y= 3.5729$ and $z= 1.926$ in

(1) we get $x = \frac{1}{27} [85 - 6 \times 3.5729 + 1.926] = 2.4255$

Putting $x=2.4255$ and $z=1.926$ in (2)

$$\text{we get } y = \frac{1}{15} [72 - 6 \times 2.4255 - 2 \times 1.926] = 3.573$$

Putting $x=2.4255$ and $y=3.573$ in (3)

$$\text{We get } \frac{1}{54} [110 - 2.4255 - 3.573] = 1.926$$

The values of x, y, z in the third and fourth iteration is almost equal. The values of x, y, z in the third and fourth iteration is almost equal. Hence the roots of the system are $x=2.4255, y=3.573, z=1.926$

Python Code to Solve Simultaneous Equation by Gauss Seidal:

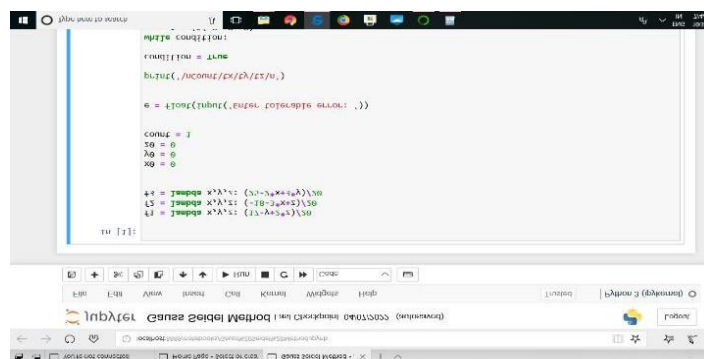

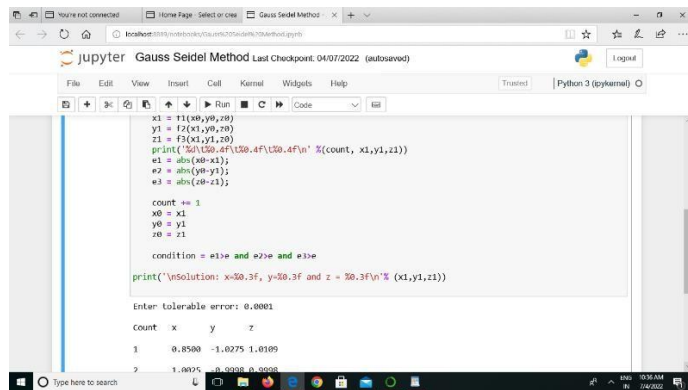

```
f1 = lambda x, y, z: (85-6*y + z)/27
f2 = lambda x, y, z: (72-6*x- 2*z)/15
f3 = lambda x, y, z: (110-x- y)/54
x0 =0, y0 =0, z0=0, count= 1
```

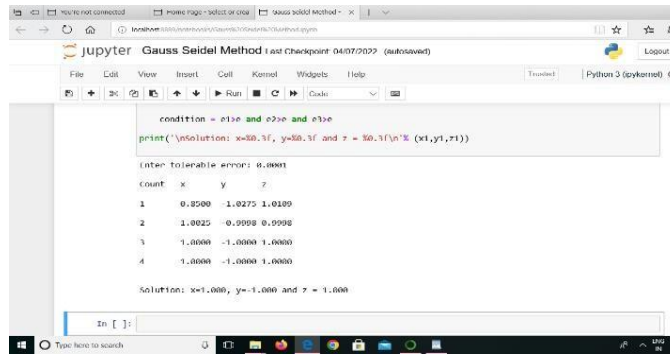

```
e = float (input ('Enter tolerable error:'))
print('\n Count\tx\t y\tz\n')
condition=True
while condition:
```

```
    x1=f1(x0,y0,z0)
    y1=f2(x1,y0,z0)
    z1=f3(x1,y1,z0)
```

```
print('%d\t%f\t%f\t%f\n' %(count,x1,y1,z1))
    e1=abs(x0-x1);
    e2=abs(y0- y1);
    e3=abs(z0-z1);
count+=1, x0 =x1, y0 =y1, z0=z, condition=e1>e and e2>e and e3>e
print('\n Solution : x=%0.3f,y=%0.3f and z= %0.3f\n'%(x1,y1,z1))
```

Illustration of Gauss Seidal in Jupyter Note:

```

condition = <function condition(x1,y1,z1)>
print("\nSolution: x=%0.3f, y=%0.3f and z = %0.3f\n" % (x1,y1,z1))

Enter tolerance error: 0.0001
Count: x: y: z:
1 0.0000 -1.0000 1.0000
2 1.0000 0.0000 0.0000
3 1.0000 -1.0000 1.0000
4 1.0000 -1.0000 1.0000

Solution: x=1.000, y=-1.000 and z = 1.000

```

4. CONCLUSION

In this paper, simultaneous equations are solved by Gauss Jacobi and Gauss Seidal methods. Our future works includes exploring various iterative methods to solve system of simultaneous equation by python Programming.
