An Evaluation of Redefining Education with Industry 4.0

Abin George, Gandhavalla Navya

Knowledge and Technology Management Division, CSIR - NAL, India.

*Corresponding author Email: abin@nal.res.in

Abstract: In recent years, a new industrial paradigm known as Industry 4.0 has begun to trend in emerging technologies in the world, helping to bridge the gap between humans and machines in ways that can only be imagined in science fiction books. This technology is rapidly gaining traction in different parts of the world as a potential tool that can maximize corporate productivity, contribute to scientific growth, enrich a country's economy, and improve people's quality of life. This paper describes the concepts of the implementation of Industry 4.0 to redefine education in India. This study aims to identify the possible uses of Industry 4.0 technologies in the area of education and how they can be utilized to facilitate learning. The question is raised on why the Indian education system needs to implement Industry 4.0. A literature study method and a SWOT analysis were used in this study. The results show that it can help to achieve personalized learning, smart classrooms, Data analytics, collaborative learning, and learning management systems. Industry 4.0 has the potential to transform education in India by providing new tools and methods for teaching and learning that can enhance the quality and effectiveness of education.

Keywords: Industry 4.0, Education 4.0, Technology, Innovation, Students, Learning Management System.

1. INTRODUCTION

India has made significant progress in education by increasing enrollment rates, reducing the gender gap in education, and improving the overall quality of education. One of the key milestones in the history of education in India was the passage of the Right to Education Act in 2009, which made education a fundamental right for all children aged 6-14 years. The act mandates that all private schools reserve 25% of their seats for children from economically and socially disadvantaged backgrounds. Another significant development has been the increase in literacy rates in India. According to the 2011 Census, the literacy rate in India was 74.04%, up from 52.21% in 1991. However, there is still a significant gap in literacy rates between urban and rural areas, and between men and women. Indian government making various initiatives like National Education Policy 2020, which aims to transform the education system by promoting universal access, inclusion, equity, and quality in all aspects of education. The Fourth Industrial Revolution, or Industry 4.0, is the incorporation of cutting-edge technology into the manufacturing process to create more efficient, autonomous, and interconnected systems. This transformational change is expected to have a huge impact on the world economy and has the potential to redefine how things are produced and delivered. In order to increase automation, real-time data collecting and analysis, and decision-making capacities, Industry 4.0 principles call for the employment of cyber-physical systems, big data analytics, the Internet of Things (IoT), and artificial intelligence (AI). In order to construct smart factories that can adapt to changing conditions, enhance production processes, and raise product quality, these technologies are integrated with human intelligence. Increased production and efficiency, lower prices, and better products and service quality are all advantages of Industry 4.0. Along with the ability to generate new revenue streams and business models, it also offers the chance to upskill current employees and create new positions. Industry 4.0 adoption does present certain difficulties, though. They include the necessity for substantial investments in infrastructure and technology, the possibility of employment displacement, and worries about data security and privacy. Industry 4.0 will undoubtedly be widely adopted despite these obstacles.

2. BACKGROUND OF THE STUDY

Industry 4.0 is a relatively new idea; thus, research is currently being conducted on it. Thoughts on the potential advantages of Industry 4.0 as well as some of the challenges associated with implementing it are highlighted in a growing body of literature. Industry 4.0 has the potential to change production by enhancing efficiency, cutting costs, and enabling greater product customization, according to a study published in the International Journal of Production Research. The report underlines the

requirement for businesses to take a strategic approach to Industry 4.0, which involves having a firm grasp of the relevant technologies and how they may be incorporated into current business operations. The significance of organizational preparation for Industry 4.0 is highlighted by another study that was published in the Journal of Business Research. In order to successfully adopt Industry 4.0, the report underlines the necessity for businesses to make investments in staff training and development as well as the creation of an innovative culture. The significance of data analytics in Industry 4.0 is highlighted by a review of the literature that was published in the Journal of Manufacturing Systems. The analysis highlights the necessity for businesses to build out advanced analytics skills in order to fully realize Industry 4.0's promise. Similar to this, a study that was published in the International Journal of Advanced Manufacturing Technology highlights the necessity of an industry-wide collaborative strategy that involves collaboration between businesses, the public sector, and academics. The report emphasizes the advantages of such cooperation, including the advancement of innovation and the creation of new technology. According to all of these studies, Industry 4.0 has the potential to transform manufacturing and other industries, but its implementation requires a strategic approach, advanced analytics skills, organizational preparation, and cooperation amongst many stakeholders.

3. SCOPE OF THE STUDY

The scope of this study is wide-ranging, including a variety of transdisciplinary themes connected to Industry 4.0 and Education 4.0. Examining how digitalization affects student learning results, identifying opportunities and obstacles for integrating technology into the education sector, and addressing concerns with equity and access, policy and governance, and economic and social implications are included.

1. **Technological Infrastructure:** This study looks into the accessibility and availability of digital infrastructure and technology in educational settings, including the hardware and software required to support Industry 4.0 and Education 4.0 projects.
2. **Curriculum and Pedagogy:** This study investigates how technology can be incorporated into the curriculum and pedagogy of education, including the creation of new teaching methodologies, the utilization of digital resources, and the implementation of individualized learning.
3. **Teacher Professional Development:** This study explores how teacher professional development including training on new tools, platforms, and digital resources can help instructors get ready to use technology in the classroom effectively.
4. **Student Learning Outcomes:** This study assesses how Industry 4.0 and Education 4.0 affect student learning outcomes, such as academic success, critical thinking, problem-solving, digital literacy, etc.
5. **Equality and Access:** This study addresses equity and access-related concerns, such as the digital divide, unequal access to technology and internet connectivity, and the possibility that Education 4.0 would exacerbate already-existing inequalities in educational outcomes.
6. **Policy and Governance:** This paper discusses the role of policy and governance, including governmental efforts, funding models, and regulatory frameworks, in supporting the integration of Industry 4.0 and Education 4.0 in educational systems.
7. **Economic and Social Impacts:** This study also includes the possible economic and social effects of Industry 4.0 and Education 4.0 on the educational sector, such as job growth, innovation, and the emergence of new markets for educational technology.

4. CURRENT SCENARIO

Using technologies like the Internet of Things (IoT), artificial intelligence (AI), robotics, and big data analytics, Industry 4.0 is already changing how organizations run and are becoming more and more common in many industries. New levels of automation and data-driven decision-making are made possible by these technologies, increasing productivity and efficiency. To be competitive in a market that is changing quickly, many businesses are making investments in Industry 4.0 technology and systems. Smart factories, which employ connected machinery and sensors to increase production, decrease downtime, and enable predictive maintenance, are being adopted by manufacturers at an increasing rate. Globally, Industry 4.0 adoption is anticipated to rise, with the Asia-Pacific region setting the pace. As businesses look to digitize their processes and boost automation, the COVID-19 pandemic has also pushed businesses to adopt Industry 4.0. Although the implementation of Education 4.0 is still in its early stages, technology use in schools has significantly increased recently. This trend has also been intensified by the COVID-19 pandemic since schools and universities have had to fast switch to remote learning. Education is being delivered in novel and creative ways thanks to the usage of digital platforms and resources including mobile apps, virtual and augmented reality, and online learning management systems. Since more people are using online learning platforms, teachers have had to learn how to use cutting-edge tools to give lectures remotely. The adoption of Education 4.0 is also being driven by the trend toward individualized learning since technology now makes it possible for each student to have a unique

learning experience. Education 4.0 is expected to see a rise in the usage of AI and machine learning, allowing for more sophisticated assessments and personalized feedback.

5. REVIEW OF LITERATURE

(Salah et al., 2019) explains techniques for using leading visualization techniques based on virtual reality in product manufacturing. Researchers argue that it is important to develop cutting-edge technologies that can effectively engage new brains in modern manufacturing processes. It is imperative that we develop innovative ideas and effective methods to provide students with the necessary competencies and prepare them for the manufacturing facilities of the future. The latest Industry 4.0 paradigms place an emphasis on visualization technologies, especially virtual reality, as a means of sustainable education and educating young people. (Jamaludin et al., 2020) mentioned in their study that raising awareness, readiness, and awareness among policymakers, teachers, and recipients (students) within globalization is related to the implementation of Education 4.0 in the Association of Southeast Asian Nations (ASEAN) region. Industry 4.0 will require academic and research institutions to employ engineers and management professionals to avoid problems in smoothly adapting to the transformative changes affecting all sectors of society. are forced to rethink and evaluate their skills. In India, few universities (especially private universities) are adopting Industry 4.0 infrastructure. Researchers have suggested several elements to enrich the curriculum as a basis for reform mentioned in the research by (Gumparthi, 2020). According to (Lukita et al., 2020) Global competition proves that HR requires strong competencies in all areas, usually technology. However, due to a lack of equitable education and a conventional education system, Indonesia lags far behind other neighboring countries. The challenge of this 4.0 era is an opportunity to promote the development of a combination of Industry 4.0 and Indonesian educational curriculum. There are literature surveys and SWOT analysis methods that can be used as references for problem-solving, and there is a considerable range. In this paper, the competencies required for the successful integration of education management into Industrial Age 4.0 are discussed and analyzed based on the facts and realities of the Indonesian education system and presented in a comprehensive curriculum. In addition (Motyl & Filippi, 2021) says that introducing additive manufacturing education is a vital measure in preparing young engineers. It is beneficial for young engineers both in terms of personal preparation as well as learning and refining different skills. In spite of this, certain aspects, such as the need for appropriate equipment and professionally trained teachers, cannot be overlooked. (Fuentes et al., 2021) study feels it is crucial to increase instructional gear that permits college students to engage with actual device that implements, an included way, allowing new technology, together with connectivity, with trendy protocols, and statistics processing withinside the cloud, device learning, virtual twins, and business cybersecurity measures. For that reason, in this work, we gift academic surroundings on Industry 4.0 which consists of those technology reproducing sensible business conditions. These surroundings consist of modern business management device technology, together with a business firewall and a digital non-public network (VPN) to reinforce cybersecurity, an Industrial Internet of Things (IIoT) gateway to switch procedure statistics to the cloud, in which it is able to be saved and analyzed, and a virtual dual that definitely reproduces the device. A set of hands-on obligations for an introductory automation route had been proposed so that scholars accumulate sensible know-how of the allowing technology of Industry 4.0 and of its feature in actual automation.

6. OBJECTIVES

1. To identify the key technologies and tools that are driving Industry 4.0 in education 4.0 and their potential impact on teaching and learning.
2. To explore the challenges and opportunities associated with the integration of Industry 4.0 technologies in education 4.0.
3. To examine the effectiveness of Learning Management systems in education.
4. To explore the potential implications of Industry 4.0 for educational policy and practice, including issues related to equity, access, and inclusivity.

7. METHODS

The current study has adopted the Literature Study Method which through a series of theories, findings, and previous research has been used as a basis for further research activities in preparing the framework of the problem being studied. In this study, only the recent 5 years of literature are only has been examined. The purpose of this research was to investigate and identify the various factors that influence the planning and application of Industry 4.0 in universities to enhance education. A SWOT analysis is been used to identify ways to improve the business and maximize opportunities, while also identifying negative factors that may hinder your chances of success. Anything that requires planning can be applied to the SWOT framework, avoiding unnecessary mistakes due to lack of insight. This helps in Communication and cooperation in policy design and ensuring consistency in policy implementation. This methodology, shown in Table 1 includes the identification and

analysis of key factors involved in the decision problem, as well as their categorization into strengths (S), weaknesses (W), opportunities (O), and threats (T) from the review of literature from the last 5 years. As discussed, context and task focus, as well as agility in the design process, are key elements of Industry 4.0 in education. Therefore, the development of the framework presented in this paper began with a focus on these five elements. (AYER & AKGÜL, 2020) mention that technology is developing rapidly and changing people's daily lives. Technology-driven professions make a difference in how we express emotions, not only in business and school but also in our personal lives. In order to grasp Industry 4.0, it is necessary to design, develop and produce technologies in all fields. However, in addition to production, it is important to train a skilled workforce that can use this new technology. At this very moment, the education sector has emerged as an area that needs to be examined in detail under Industry 4.0. The framework of Industry 4.0 is very important in addition to knowledge, it should emphasize creative thinking and design education policy based on lifelong learning. This study defines Industry 4.0 in education in terms of five major benefits: personalized learning, smart classrooms, data analytics, collaborative learning, and LMS. Figure 1 indicates the conceptualized framework to redefine education with Industry 4.0.

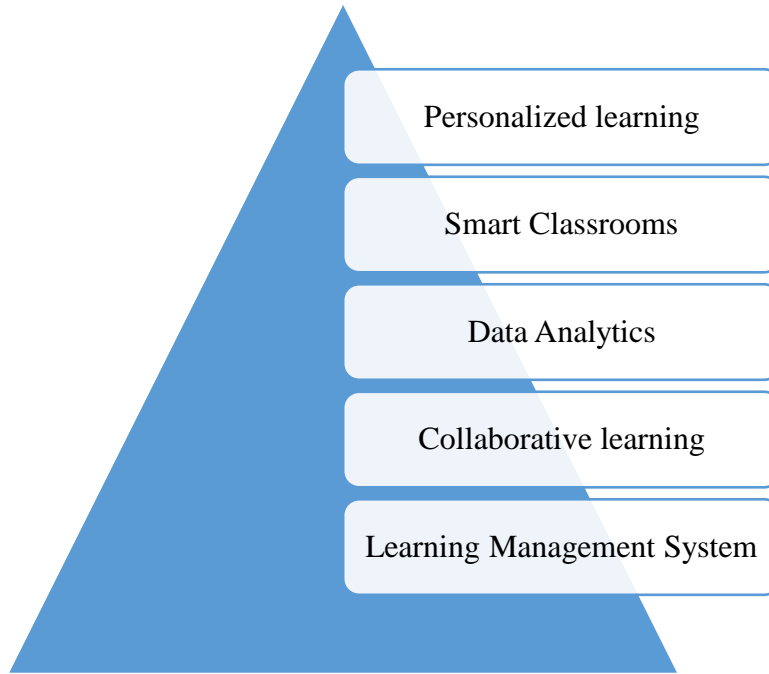

FIGURE 1. A Conceptual Framework to redefine Education with Industry 4.0

Based on Table 1 and Figure 2 this study explained using the SWOT analysis method to evaluate Strengths, Weaknesses, Opportunities, and Threats to adopt Industry 4.0 to redefine education.

TABLE 1. SWOT Analysis

Strengths	Weaknesses	Opportunities	Threats
Internal Factors		External Factors	
Growing digital natives	Unequal access	Address teacher shortages	Significant investment
Established IT industry	Digital divide	Personalized learning	Rapid technological change
Government initiatives	Resistance to change	Reach underprivileged	Lack of regulation
Addressing challenges	Quality disparities	Global leadership	Uneven distribution
Education Diversity	Variable infrastructure	Knowledge-sharing	Uneven quality
Pandemic highlight	Marginalized groups	Lifelong learning	Fraudulent products
Workforce preparation	Stakeholder resistance	Innovation ecosystem	Tool obsolescence

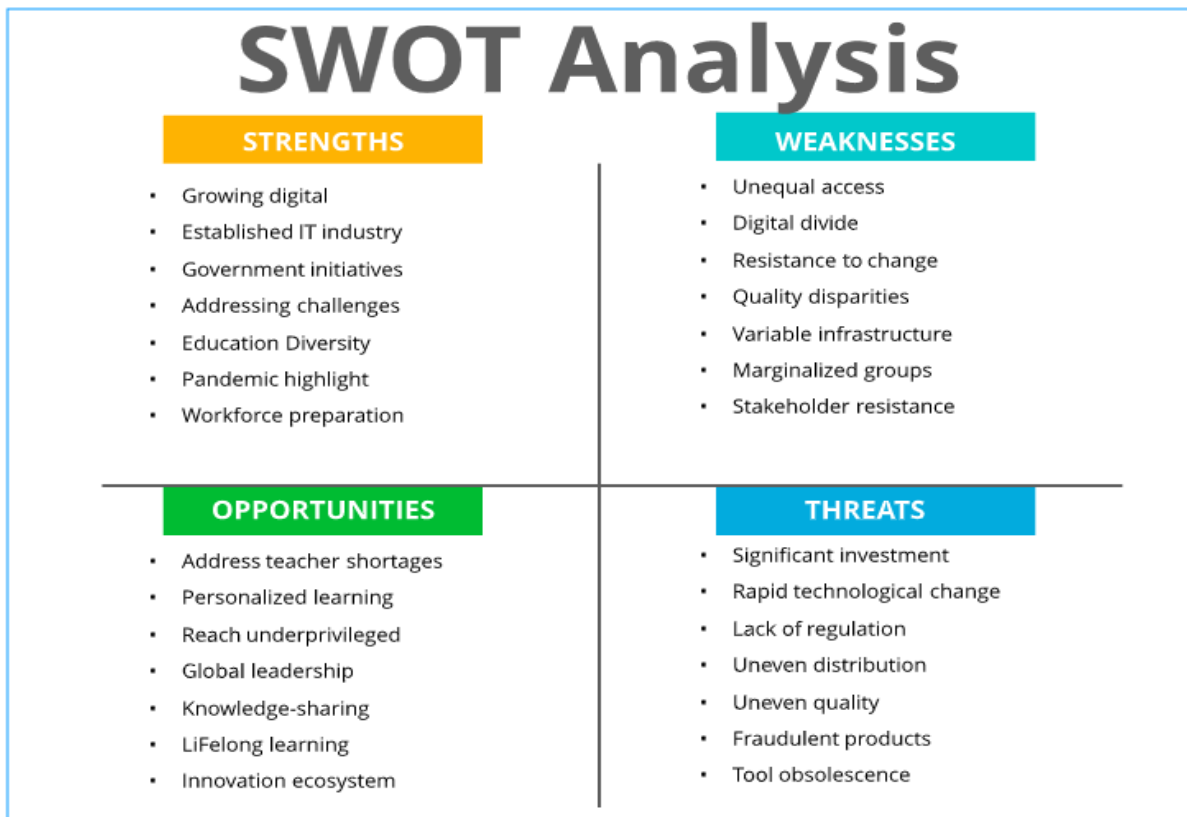

FIGURE 2. Swot Analysis of Implementation of Industry 4.0 in Education

8. FINDINGS AND CONCLUSIONS

The rise of the industrial revolution also led to the educational revolution, which have majorly triggered economic growth. Education 4.0 offers more innovative and creative ideas, advanced technology and digital tools to help you learn at your own pace. Education 4.0 brings better learning success. Both Industry 4.0 and Education 4.0 have brought about many changes and improved the economy. It also lays the foundation for the Fifth Industrial Revolution, or Industry 5.0, enabling industry to work with institutions to achieve better and more efficient outcomes. With real-time machine and device communication, Industry 4.0 is expected to provide even more automation and interconnectivity in the future. Predictive maintenance and autonomous decision-making will be made possible by the predicted expansion in the use of AI and machine learning. With the help of technologies like 5G networks, edge computing, and blockchain, industry 4.0 is predicted to continue to advance and transform. These technologies will make it possible to send and process data more quickly and securely, which will boost productivity and efficiency even further. Additionally, new employment possibilities will be generated by the implementation of Industry 4.0, particularly in the fields of cybersecurity and data analytics. The use of AI to deliver adaptive learning experiences and personalized learning is likely to receive more attention in education. Technology will enable adaptive learning in the Education 4.0 era, which will provide tailored learning experiences that adapt to each student's requirements and talents. The COVID-19 pandemic has also brought attention to the value of digital literacy, which is projected to increase going forward as technology continues to change how we study and operate. Industry 4.0 is transforming education through the use of technology. Teachers and students now have access to a wide range of digital tools and resources, such as online learning platforms, educational apps, and virtual and augmented reality technologies. These tools can enhance the learning experience, making it more engaging and interactive. The level of education at which they are most present in higher education. Together, they improve content immersion, student participation, and interpersonal relationships, reduce costs and risks, simulate real-world work scenarios, and enhance learning opportunities without limiting time and space. It also develops soft skills and learn how to use and work with technology. The study concludes that Industry 4.0 technologies can support the holistic learning process. They are still largely confined to university and production-related courses. It is hoped that this initiative will contribute to the development of Education 4.0 at all stages of education.
